-17 In general, these devices or components are used to control or manipulate electromagnetic radiation (EMR) and, therefore, have great importance in the field of communication. For example, they are used in frequency filters, antenna elements, microwave transmitters and transceivers, high power devices, radar or radio systems, electromagnetic radiation detectors, and microwave resonators. The present invention relates to a solid state electromagnetic radiation device, which is fabricated using a molecular beam epitaxy (MBE) technique. The conventional art with respect to a variety of solid state electromagnetic radiation devices are, for example, shown in the following publication. (1) "Reduction of surface recombination and consequent reduction of dark current in III-V alloy/GaAs/AlAs-superlattice heterostructures", A. Shibata, S. Takahashi, S. Ogo, N. Kumagai, S. Yomo, S. Takayanagi, and M. Koyanagi, Appl. Phys. Lett. 60 (16), 10 Jan. 1992, pp. 2238-2240. (2) "InAs/InP heterostructure for high performance microwave devices and heterojunction bipolar transistors", C.
