Revit represents real world assets as Building Information Model (BIM) that can be created with Construction Documents (CD). Revit works as a BIM software. It provides advanced functions for construction projects. Revit has many applications and uses: Architecture Landscape Architecture Building engineering Construction documents Revit Architecture Revit Architecture is the software package which contains the functions and features that are needed to create and edit architectural designs. It is currently the market leader. It was developed by Autodesk in 2003. Autodesk Revit Architecture 2015 provides a scalable collaborative workflow that allows its users to create, share and model projects. It has an easy-to-use interface, optimized for creating 2D and 3D models and a powerful suite of modelling tools that allow for the creation of high-quality 2D and 3D models, as well as for the management of project-related information. It has a unique feature called "3D Warehouse" which allows its users to download full models and parts from other users for free. Revit Architecture consists of the following components: Overview of Architectural Construction Design Overview of Architectural Electrical Design Overview of Architectural Mechanical Design Revit Architecture 2015 Revit Architecture 2015 is the release for Autodesk Revit Architecture, version 2015. It was released on June 5, 2015 and the next version is called 2017. Architectural Design Specifications Revit Architecture 2015 is used to create project specifications, or design specifications. Revit Architecture 2015 can save the 3D model of a project, as well as the project specifications. Design Journals Design journals are Autodesk Revit Architecture 2015 function that allows you to take snapshots and mark up 2D models with traditional blueprints or schematics. The snapshots show where a design has changed during the design process. Revit Architecture Design Checklist Autodesk Revit Architecture Design Checklist is used to manage the process of the design and construction of buildings, or the construction process. It is used to check whether a project is ready for construction or not. It has the following functions: Checklist Completion Check (for Building Design) Checklist Checked (for Building Design) Contract Completion Check Contract Checked Quantity Survey Check Revit Architecture Workset Check Architectural Design Collaboration Autodesk Revit Architecture Design Collabor f3e1b3768c
