AutoCAD The first major AutoCAD release, AutoCAD 1.0, was released in 1982. It was a significant advance in the field of CAD because it ran on a personal computer. AutoCAD was also a "one price fits all" experience; the price was only \$595. The

first AutoCAD was called the Approximate Drafting System (ADS), later renamed AutoCAD 1.0. The first released version of AutoCAD 1.0 did not have any of the features that are standard with current AutoCAD. Before AutoCAD 1.0, many of the tools included in AutoCAD were found in a separate program called RasterDraw. RasterDraw was developed by

Microtec in 1977 and supported only the CGA graphics card. RasterDraw could draw lines, circles, circles with angles, polygons, polylines, and arcs and would present the user with several tools for editing these objects. RasterDraw, however, did not have any other features.

It could not be used for complex drafting, and its functions were limited to simple 2D drawing. A few

other companies such as NewTek and Tandberg also developed CAD programs for the Apple II series. NewTek released its first CAD program, Tandberg's Tandberg Max, in 1979 and a simplified version, called MicroMax, was released in 1980. Other manufacturers such as Pantronics and Borland also released CAD programs for the Apple II during the late 1970s and early 1980s.

AutoCAD was intended to provide a complete 2D drafting program in a single integrated package, and the first released version of AutoCAD provided all of these features. The original version of AutoCAD 1.0 was available for the Apple II and MS-DOS operating systems. In 1983, AutoCAD 2.0 was released for the Apple II and PC DOS operating systems. A month later, AutoCAD 2.5

was released for the MS-DOS operating system. AutoCAD 3.0 was released in

softwareAn introduction to
differential equations A linear
second order differential
equation is of the form where c
and a are the two constants and
x(t) is the unknown function.
This equation is often called
homogeneous because the
coefficient of the first

derivative is zero. The associated matrix is How do we solve these equations? The key to solving these equations is to realise the similarity between this equation and another important equation, the equation of a spring: (when the spring is compressed, say from position x to $x + dx$, its force is proportional to dx and its displacement is proportional to dx . There is an energy stored in

the spring. In the case of an elastic rod or spring, the energy stored depends on the distance it has been compressed. We call this energy the potential energy of the spring). Similarly, the second order differential equation corresponds to an equation of motion (a spring: a mass at the end of the spring), an equation of motion can be written: and for small dx we get Thus we see that this equation

of motion has the same form as the differential equation of a spring. The characteristic polynomial of this equation is with roots: The roots are called eigenvalues of this equation. If the motion of the spring is slow compared to its periods of oscillation, we see that the motion is essentially a periodic oscillation with some frequency. The eigenvalues are related to the frequency of the

oscillations. The motion is said to be stable if the real part of the roots are all negative and unstable if they are all positive.

How do we solve these equations? It turns out that the solution to a differential equation can be written as an exponential function. To do this we need a little bit of linear algebra. Let z denote a complex number and let v be a complex vector. For example, (where k

is a complex number and a is a real vector). Then, What this means is that we take the exponential of the sum of the scalar part and the vector part.

Once the Autocad is installed it will start to download the newest version of Autocad 2013. Note: We will not be able to work on project without this version of Autocad Sigh. While I like the sound of this series and I am excited to see if it will be able to live up to the hype, this is going to be a terrible pilot. I can already tell that

most of the main characters are going to die in this one. Sure, the show can be saved by the strong ensemble cast and the good writing, but it's going to be an uphill battle. I'm not liking how the deaths seem to be completely random, and I'm also not liking how sad it is going to be to see several characters die. I get the fact that the episode is going to be a cliffhanger, but I don't think it's

going to be much of a cliffhanger. I think the people will die in different ways or with different injuries. I'm not sure if that's the smart move though. I'm also not sure how the hour-long finale is going to be. I'm not sure if it's going to just be a bunch of different storylines happening at once or one main storyline will have the entire hour. As it stands now, they need to pick a time slot for

this episode so that it doesn't seem like filler.

Giraffes steal, too. Next time you're walking with a giraffe, look around for the other animals. They may be trying to steal it, too.
