Regarding the two v3.2 versions it doesn't matter which one you download, but do make sure that you have the correct libraries installed.

Regarding the variable number of channels, Nuendo is usually one channel per instrument, then one MIDI channel. If you created more than one instrument, make sure that you mapped channels properly - it's usually one or two MIDI keyboard channels per instrument. Regarding the custom mix: It's unlikely that you'll want to go back and mix down the project. It would take hours of work, and it's usually too time-consuming to do it like this. You can use Cubase's session manager to change the order of the tracks in your project - that's the only way of mixing the song. So you could probably add a track for the music, a track for vocals and another for percussion. It would be helpful to know where you want to store your mixes, so that you have a separate folder for each. Having separate folders for each song is possible. Q: What's the difference between mailserver and mail transport What's the difference between mailserver and mail transport? What I'm asking here is, mailserver is a

host offering SMTP service is what I read from this link. And mail transport refers to the mail service in use, for example, sendmail transport is the sendmail process. But I'm confused, when I receive mail from my sender, what happens behind the scenes? Does a mailserver act as a relay to send the mail to the recipient? A: A mail transport (MT) is the protocol that defines how mail is sent from one system to another. The systems interact using a mail transfer agent (MTA) that sits in between. The MTA is the mail transfer agent: it opens the session and tells the server to send the mail on to the next MTA. Once the message gets to its destination, the MTA may open a second session to tell the destination MTA to finish the delivery. Some MTAs can complete delivery to more than one server and rely on a delivery agent to complete the delivery (e.g. Sendmail). A mailserver (typically also called an SMTP server) is a mail server that provides an SMTP service on its own or through an MTA. It can be a single server or can consist of a collection of servers. All mail that is sent by a
