Cd Driver Bolt Bl1; Search Results forÂ . . You can fix these problems on your own or by using DriverÂ .Q: Why does arff recognize arff? I read the following: I have a set of images in matlab form of which I save images(i) = imread('P\i.jpg') Now, imwrite('P/images.arff',images(i)) I saved it as im.arff (then I used the command) arffread('im.arff') It said that it had read im.arff successfully. I want to know how it recognized it. Shouldn't it be something different like a1.arff? If yes then why is it so? A: It's because ".arff" is the extension for arff (AAssociated Referent File), which is a standard textual format for representing a graph structure (also called an adjacency list). It's not related to Matlab (or Matlab data types); you could have saved it with "tes.arff" or "i2.arff" and the result would be the same. d0c515b9f4
