\* To get started, download Photoshop from Adobe's website at [www.adobe.com/products/photoshop.htm](http://www.adobe.com/products/photoshop.htm). The file is approx. 1.2 MB in size, and you'll need Windows for it to install. \* Photoshop is a member of the Adobe Creative Suite, a group of popular programs for professionals who need to design, animate, or make other changes to images. (For more information on the Creative Suite, visit [www.adobe.com/creativesuite.html](http://www.adobe.com/creativesuite.html).) The following sections introduce the Photoshop editing system, explain how to customize it, discuss the many important tools, and look at the main menu items for quick access to functions and commands. \*\*Figure 3-1:\*\* The four main Photoshop windows. Photoshop Edit Window Each Photoshop window has four tabs, as shown in Figure 3-1. The Tabs panel on the left side of the window is the most useful one for adjusting your image: \* Click the arrow next to the Tabs panel and select the arrow on the right to display the other three windows. The three windows available on the right are (in order) Image, Adjustments, and Layers. The Photoshop Image window is where the image you're editing is located. Layers, Adjustments, and History enable you to work on your image. The Layers window is where you create and manage layers, the important way of organizing, organizing, and organizing images for image editing. Adjustments works with the three tools that enable you to alter the look of your image and define the overall look of the completed project. Finally, the History panel is a list of all the editing actions that you take on the image. From it, you can back up your work to undo any changes if you decide to make edits. It also allows you to preview the previous images that you've opened. The Photoshop Channels window provides information about the color in your image. You can also add and subtract red, green, blue, and alpha values directly in the window. \*\*Figure 3-2:\*\* The Layers window has the layers that you create. Image Tools The powerful tools that the Photoshop Image window offers are as easy to use as they are numerous. Here are some of the most important ones: \* The Eraser tool (E), shown in Figure 3-3, is used to erase areas of the image. To

DESCRIPTION (Applicant's abstract): This is an application for a K23 mechanism award for Dr. Pierre Frangie (PI), a general internist and pediatrician at the University of California, San Diego, with 5 years of mentored research experience. Dr. Frangie is developing a career in patient-oriented research in the field of asthma and is proposing a 5-year training and research plan to prepare him for becoming an independent investigator and developing clinical trials in the management of pediatric asthma. Hermentia Medicine, Inc., has licensed Dr. Frangie's novel imaging device, the Optineye, which images tear production as a marker of ocular allergies, and is also developing a diagnostics test for mucosal inflammation. This K23 award, together with support provided by Hermentia's Advisory Board, would form a critical step in Dr. Frangie's career development as a physician-scientist. To gain experience in the field of clinical research, and knowledge about epidemiology, genetic principles, and biostatistics, Dr. Frangie proposes a combination of formal coursework and mentoring. To establish himself as an independent investigator in the field of asthma and allergic disease, Dr. Frangie has assembled a team of mentors and advisors comprised of four physicians with expertise in asthma epidemiology (Ernest Haire, MD); development of imaging devices for allergic disease (Paul Eck, MD); immunology and pulmonary medicine (D. Gary Davis, MD); and genomics and proteomics of allergy and asthma (Roy Parker, PhD). Dr. Frangie will also be mentored by a strong team of scientific advisors who are experts in the field of asthma and allergy (Henry Abrams, PhD; Susan Lee, PhD; Bruce Sall, PhD), and genomics and proteomics (Jerry Murphy, PhD). In addition, Dr. Frangie has established an Advisory Board of other experienced scientists and clinicians to provide scientific and clinical oversight (Margaret Alving, MD; Terri Nyhan, PhD; Martin Kohn, MD; Patrick Manning, PhD) during the award period and the transition period into independence. To address the studies that are being developed in this proposal, Dr. Frangie and his team have developed a two phase, proof of concept study to evaluate the ability of the Optineye to diagnose the presence of asthma exacerbations in young children. The first phase, an observational study will evaluate the diagnostic accuracy of the Optineye in detecting disease in a

Permeabilized products ready to be cooked or packaged in an aseptic manner are generally known in the art. Such products are typically prepared by packaging a product which is permeable and leak resistant in a container which is impermeable and leak proof. The packaging process is achieved by applying heat, vacuum, a combination of the two or a gaseous substance to the product and retarding the permeability of the package or container to reduce leak rates thereby sealing the product within the package or container. Conventional methods and apparatus for accomplishing these packaging steps require excessive consumption of energy, time, and materials. During the packaging process, leaks in the package or container can result. Conventional methods of sealing packages require that a vacuum be applied to the interior of the package or container to achieve proper sealing. However, if a leak occurs within the package or container, the vacuum is applied to only the interior of the package or container and not to the exterior of the package or container. Consequently, product which has leaked out and begins to solidify remains sealed within the package or container. Moreover, the vacuum must be maintained until the product has solidified. Various methods have been developed for the purpose of providing packages or containers which substantially minimize the potential for leakage in the packaging process. One such method is to apply a controlled vacuum or other aseptic retarding conditions to the exterior of the package or container to achieve a desired seal. However, such methods generally require additional energy for the purpose of maintaining such conditions within the package or container. Further, such methods often require a relatively large package or container, particularly for products with small molecular weights which tend to leak rapidly from packages or containers as a result of permeability to gases. Moreover, such methods generally require that packages or containers be sterilized, i.e., heat processed, which is relatively time consuming and expensive. Packages or containers which are properly sealed should be capable of maintaining their integrity for a period of time when it is desirable to maintain such integrity. For example, if the product is a consumable product, it is desirable to maintain the integrity of the package or container for a period of time when the product is stored in a consumer's home. For example, if the product is a consumable food product, it is desirable to maintain the integrity of the package or container during shipping of the product to a location for consumption or use by the consumer. Such consumable product may be a juice which is stored in a jar having a foil laminate cover
